The report requires updating with new data and is sent in 48 hours after order is placed.

Transformer-based UPS systems are the most common power supply technology for 100 kVA and above, with the option to achieve large kW sizes or provide redundancy. The machine has an isolated DC function to ensure the load's safety. This transformer effectively isolates the DC component of the inverter output from the load, improving load protection, especially for switches and inductive loads. Compared to transformerless UPS, transformer-based UPS have the advantages of stability, reliability, high overload capacity, and impact resistance. Furthermore, the transformer-based design allows the UPS to be installed in harsher operating environments than transformerless units.

The global Online Transformer-Based UPS market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
