Onsite cryogenic air separation plants are industrial facilities designed to separate atmospheric air into its primary components (mainly nitrogen, oxygen, and argon) at the location where these gases are needed. These plants use cryogenic distillation, a process that involves cooling the air to extremely low temperatures until it liquefies, and then distilling the liquid air to separate its components based on their different boiling points

The global Onsite Cryogenic Air Separation Plants market size is projected to grow from US\$ 3791 million in 2024 to US\$ 4867 million in 2030; it is expected to grow at a CAGR of 4.3% from 2024 to 2030.
