An open flight helmet is a helmet used in the aviation field, especially suitable for some specific flying situations, such as helicopter flying, light aircraft flying or military flying. The main features and advantages of this type of helmet include the following: First, an open-face flight helmet does not have the visor or enclosure portion of a full-face helmet, so the face is exposed. This design provides greater visibility and hearing range, which is especially important for pilots, allowing them to better observe their surroundings and hear various audible cues. This is critical for pilots to judge and react in complex or dangerous flight conditions. Second, open-face flight helmets are often equipped with advanced communication systems, including built-in microphones and headphones, so that pilots can communicate in real time with the ground or other crew members. This type of equipment is usually optimized to provide clear sound quality in high-noise environments. In terms of safety, open-face flight helmets are usually made of high-strength materials such as fiberglass, carbon fiber or other composite materials. These materials provide effective protection in the event of an accident or emergency, while maintaining the helmet's lightweight design and improving pilot comfort. Additionally, open-fit flight helmets may come with some custom features, such as visors, goggles, or goggles, to provide additional protection or handle different weather conditions. These accessories can be adjusted and replaced according to the needs of the flight mission and environment.

The global Open Flight Helmet market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
