The open plunger pump is a common positive displacement pump, and its working principle is based on the reciprocating motion of the plunger inside the pump body. This pump design includes one or more plungers that are connected to a cylinder inside the pump body. When the plunger advances forward under the action of the driving mechanism, the liquid in the pump body is squeezed out; and when the plunger contracts backward, the liquid is sucked into the pump body. This motion cycle creates a continuous flow of liquid, allowing the open plunger pump to provide stable flow and pressure. Open plunger pumps are commonly used in applications requiring high-pressure, high-precision liquid transfer, such as high-pressure cleaning, chemical processing, lubrication systems, injection equipment, etc. Their design is simple, easy to maintain, and allows efficient flow regulation and pressure control. Therefore, it is widely used in many industrial fields.

The global Open Plunger Pump market size is projected to grow from US\$ 2605 million in 2024 to US\$ 3384 million in 2030; it is expected to grow at a CAGR of 4.5% from 2024 to 2030.
