The global Open X-ray Inspection System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Open X-ray detection system is a detection device based on X-ray technology. It transmits X-ray beams and receives rays after penetrating the object, and uses computer processing technology to convert the received signals into images, thereby realizing visual detection of the internal structure of the object. This system usually has an open design, which allows the X-ray source and detector to be flexibly arranged to accommodate detection objects of different shapes and sizes. During the detection process, this system will not cause any physical or chemical damage to the object being inspected, so it is widely used in many fields.

Open X-ray inspection systems have some unique technical features compared to closed systems. Open X-ray sources are usually able to achieve smaller focal sizes and higher magnifications, thereby providing higher detection accuracy and resolution. This is particularly important for areas that require high-precision detection, such as integrated circuits, electronic manufacturing, etc. The design of the open X-ray tube allows the replacement of the cathode and anode/target, which increases the flexibility and maintainability of the system. However, this may also result in a higher initial equipment acquisition cost. The high voltage range of open X-ray tubes is usually wide, which can meet the voltage requirements under different detection needs. In summary, the open X-ray inspection system market has shown a positive development trend, and the market is expected to continue to maintain a rapid growth trend in the future.
