An operator automation platform is a comprehensive platform built upon algorithmic operators and automated execution engines. It enables operator orchestration, automated scheduling, and efficient execution in data processing, model training, AI inference, and business processes. This platform typically integrates operator management, task scheduling, resource scheduling, monitoring, and log analysis, modularizing, standardizing, and automating the operation of discrete operators. This reduces manual intervention, improves computational efficiency, and accelerates AI model deployment and business process automation. Operator automation platforms are widely used in AI development, data platforms, intelligent manufacturing, financial risk control, and scientific computing, providing enterprises with efficient, reusable, and scalable operator execution and management solutions.

The downstream customers of operator automation platforms primarily include AI developers, enterprise data platforms, intelligent manufacturing companies, fintech companies, and scientific computing institutions. These users leverage the platform to achieve modular operator management, automated task scheduling, and efficient execution, thereby accelerating AI model training, data processing, and business process automation. In AI development and data platform scenarios, the platform helps enterprises reduce redundant development and maintenance costs, and improve operator reuse and computing efficiency; in intelligent manufacturing and scientific research computing, it enhances the level of automation in production or scientific research. Because the platform is typically an enterprise-level SaaS or locally deployed
