## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

During a vitrectomy, an ophthalmologist (medically trained eye specialists), will remove the vitreous humour, a clear gel-like substance that lies behind the iris. In doing so, they will gain access to the back of the eye, where they may repair the damaged retina. At the end of the vitrectomy surgery, the ophthalmologist is required to fill the space left by the vitreous gel. This can be achieved by injecting a small amount of Ophthalmic Gases into the eye, in order to maintain the pressure required to allow the retina to remain in place and adequately heal.
