An ophthalmic nebulizer is a medical device used to administer medication in the form of a fine mist or aerosol directly to the eye. It is designed to deliver therapeutic agents, such as medications or lubricants, to the ocular surface for the treatment of various eye conditions, including dry eye syndrome, conjunctivitis, and corneal diseases. The nebulizer works by converting liquid medication into tiny droplets or particles that can be easily absorbed by the tissues of the eye. Ophthalmic nebulizers offer advantages such as targeted drug delivery, improved bioavailability, and reduced systemic side effects compared to traditional eye drops or ointments. They are commonly used in ophthalmology clinics and hospitals as a non-invasive and convenient method of ocular drug administration.

The global Ophthalmic Nebulizer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
