Ophthalmic trial frames are adjustable frames that are used to hold lenses during refraction test and during retinoscopy test of the eye. Ophthalmic trial frames are eyeglasses designed in such a way that different lenses can be inserted and can be used to correct refractive errors of vision. Ophthalmic trial frames are light weight, adjustable and should have a comfortable nose resting and can be adjusted to allow accurate centering. Ophthalmic trial frames usually have 3-4 compartments. First compartment is for the high powered lens, second for the spherical lens, third for the cylindrical lens and fourth for the accessory lens and prisms. Cylindrical lens compartment should be accurate and have smooth rotation. There are two main kind of Ophthalmic trial frames mainly PD fixed trial frames and adjustable trial frame which have axis rotation disc to measure the several lens holder and astigmatism. Lens of

varying lengths is placed in the ophthalmic trial frames. Ophthalmic trial frames should be easy to adjust both PD and corneal alignment while providing a sure mounting for trials lens. Some ophthalmic trial frames come with a metal rim with a handle that reflects power of the lens engraved upon it.

North America is expected to grow in the ophthalmic trial frames market due to rise in the eye disorders which is caused by more usage of the television and computers and rise in the pollution which causes allergy and dry eyes which ultimately lead to the overall increase in the ophthalmic trial frames market along with the adoption of new technology in the market.
