The opposite operation glove box is a special experimental equipment, which is designed to allow two or more operators to enter and operate the items in the box through the glove ports from opposite sides, while keeping the environment in the box highly pure. This glove box is usually equipped with high-purity inert gas circulation systems, vacuum pumps and filters to remove oxygen, water vapor and other active substances, thereby ensuring that the environment in the box reaches the purity and oxygen-free and water-free conditions required for the experiment. The opposite operation glove box is widely used in many fields, especially in occasions where precise control of the experimental environment is required, such as chemistry and materials science, battery and energy research, semiconductors and microelectronics. Through the opposite operation design, operators can more conveniently perform complex experimental operations and improve experimental efficiency and accuracy.
