An optic nerve glioma is a type of brain tumor. There are multiple kinds of brain tumors. Typically, each type of tumor is named after the kinds of cells it affects. Most optic nerve gliomas are considered low-grade and don't grow as quickly as other types of brain tumors. They are found in the optic chiasm, where the left and right optic nerves cross. They are also referred to as optic glioma or juvenile pilocytic astrocytoma. Optic nerve glioma is a rare kind of cancer that's typically slow growing and found in children. It is rarely found in individuals over the age of 20. It has also been associated with the genetic disorder neurofibromatosis type 1, or NF1.

Treatment for these cancers is best done by a multidisciplinary treatment team. Surgery and radiation therapy are two possible ways of treating optic nerve glioma. Surgery may

be performed if doctors believe they can use it to completely remove the tumor. Alternately, if the tumor is not completely removable, surgeons may remove parts of it to help relieve pressure in the skull. Radiation therapy can be done before surgery to shrink the tumor before doctors it. Alternately, it may be done after surgery to kill any remaining cancer cells. Radiation therapy involves using a machine to aim high-energy rays at the site of the tumor. Chemotherapy uses medications to kill cancer cells. This is particularly useful if the cancer has spread to other parts of the brain. Corticosteroids may be administered to reduce swelling in the skull.
