An optic nerve stimulation device is a medical technology designed to stimulate the optic nerve to restore or enhance vision in individuals with visual impairments or neurological disorders. These devices typically involve implanting electrodes or applying electrical pulses to the optic nerve or its associated pathways, aiming to evoke visual sensations or improve visual function. Optic nerve stimulation is used for various conditions, including optic nerve damage, retinal degenerative diseases, and certain types of blindness. The device works by generating electrical impulses that simulate the natural neural signals of vision, which are then interpreted by the brain as visual information. This approach represents an advanced therapeutic option in the field of neuroprosthetics and vision restoration.
