An Optic Nerve Stimulation System is a medical device designed to enhance or restore vision by electrically stimulating the optic nerve. This system typically involves an implanted electrode array positioned near the optic nerve or within the visual pathways, which delivers electrical impulses to stimulate the nerve and generate visual perceptions. It is used primarily for patients with retinal degenerative diseases or other conditions that impair vision but whose optic nerve remains functional. The system works in conjunction with external components, such as a camera or visual processor, to capture visual information and convert it into electrical signals that can be transmitted to the optic nerve. The goal is to provide a form of visual input to the brain, potentially improving the user's ability to perceive visual stimuli.
