The global Optical Axis Shape Measuring Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Optical axis shape measuring machine (OASMM) is a device for high-precision measurement of the shape and quality of optical components such as lenses and mirrors. It uses interferometry, a technique that involves measuring interference patterns generated when light waves interact with the surface of the component under test. OASMM typically consists of a laser source, a beam splitter, a reference surface, and a detector. The laser beam is divided into two beams, one reflected from the reference surface and the other reflected from the component under test. The two beams are recombined and the resulting interference pattern is detected by the detector. By analyzing interference patterns, OASMM can determine the shape and quality of optical components. It can detect small changes in the shape of components, such as deviations from a perfect sphere or flatness, and can measure parameters such as radius of curvature, surface irregularities, and optical power.

United States market for Optical Axis Shape Measuring Machine is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
