## Abstracts

The global Optical Coating Target Materials market size is predicted to grow from US$ 1374 million in 2025 to US$ 2225 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Optical coating targets (in this article) refer to sputtering targets used in industries such as optical components, optical communication devices, and architectural glass. They serve as material sources in vacuum coating processes, depositing functional thin films via magnetron sputtering or other physical vapor deposition methods. These targets are typically composed of high-purity metals (such as Al, Ag, Ti), alloys (such as Mo alloys), and oxides/nitrides (such as SiO?, TiN, ITO), achieving a purity of over 99.99%. They possess characteristics such as uniform composition, low particle defects, and reliable bonding. They solve key problems in optical films regarding transmittance, reflectivity, spectral selectivity, weather resistance, and large-area uniformity, making them core materials for realizing high-performance optical devices, low-loss optical communication systems, and energy-efficient architectural glass. The gross profit margin is approximately between 20% and 30%.

The upstream sector consists of high-purity metal/compound raw materials (Ag, Al, Ti, In, Sn, etc., purity ?4N), the midstream sector is target material manufacturing (powder metallurgy, welding, grain control), and the downstream sector comprises optical components, optical communication devices, and architectural glass. Future trends include high-purity, composite, and large-area rotating targets, as well as closed-loop target material recycling to reduce costs. Domestic companies are making rapid breakthroughs in architectural glass and optics, while international giants still control high-end ITO and large-size targets.
