The global Optical-Fiber Isolated Probe market size is predicted to grow from US$ 31.3 million in 2025 to US$ 58.57 million in 2032; it is expected to grow at a CAGR of 9.5% from 2026 to 2032.

The optical fiber isolated probe is a test and measurement device based on optical fiber transmission technology. It achieves complete electrical isolation between input and output through electrical-optical-electrical signal conversion. It has ultra-high common mode rejection ratio and isolation voltage, can effectively isolate common mode interference, and can accurately restore signal waveforms even in high-voltage and complex environments. The optical isolation probe hardly interferes with the circuit being tested and is particularly suitable for capturing high-frequency and weak signals.

Compared with traditional differential probes, the bandwidth of optical isolation probes has been increased from hundreds of MHz to more than 1GHz, and the isolation voltage can reach ±60kV or even higher. It can still maintain a high common mode rejection ratio in complex electromagnetic environments, and is especially suitable for the high-frequency and high-voltage testing needs of third-generation semiconductors (such as silicon carbide SiC and gallium nitride GaN). As a core tool in the field of high-frequency and high-voltage testing, it has shown significant potential for technological iteration and market expansion in recent years, driven by the third-generation semiconductor, new energy, communications and other industries.

Chinese enterprises such as Micsig and Pintech have found domestic alternatives through independent research and development, and their products have significant cost-effectiveness advantages. International companies such as Tektronix and Teledyne LeCroy have maintained technical barriers in the high-end market with high

precision, wide dynamic range and patented optoelectronic technology. The optical isolation probe industry is at the intersection of the technology dividend period and the market explosion period. In the future, the industry will compete around high frequency, intelligence and globalization.
