The global Optical Fingerprint Sensor market size is predicted to grow from US\$ 813 million in 2025 to US\$ 1224 million in 2031; it is expected to grow at a CAGR of 7.1% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

An optical fingerprint sensor is a device that uses optical technology to acquire and identify fingerprints. It uses different working principles and technologies compared to traditional capacitive fingerprint sensors. It usually uses a combination of an optical magnifier and a photoelectric sensor to image the details of the fingerprint onto the sensor.

Optical fingerprint sensor involves capturing a digital image of the print using visible light. This type of sensor is, in essence, a specialized type of digital camera. The top layer of the sensor, where the finger is placed, is known as the touch surface. Beneath this layer is a light-emitting phosphor layer which illuminates the surface of the finger. The light reflected from the finger passes through the phosphor layer to an array of solid state pixels (a charge-coupled device) which captures a visual image of the fingerprint. A scratched or dirty touch surface can cause a bad image of the fingerprint.
