Optical functional film is a thin film material with specific optical properties, usually used to change or enhance the propagation, absorption, reflection or transmission of light. These coating layers can be designed to have various optical effects as needed, such as transparency, anti-reflection, reflection, polarization, color filtering, optical enhancement, etc. Optically functional films are typically composed of multiple layers of materials, each with specific optical properties and thickness. These film layers can be made of inorganic materials, organic materials, or a composite of the two. By controlling the thickness and material selection of each layer, the optical properties of the film can be adjusted.

The global Optical Functional Film market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
