The global Optical Grade COC-COP market size is predicted to grow from US\$ 1204 million in 2025 to US\$ 1923 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

Cyclic Olefin polymers (COP), also called Cyclic Olefin Polymer (COP) is a new class of polymeric materials with property profiles which can be varied over a wide range during polymerization.

Based on the polymerization routes, there are two main categories of the product: Cyclic Olefin Polymer (COP) and Cyclic Olefin Polymer (COP). Cyclic Olefin Polymer (COP) and Cyclic Olefin Polymer (COP) comprise a relatively new class of amorphous thermoplastic polymers and are described together because COCs and COPs are very similar, with the exception that COPs use a single type of monomer during formulation.

Cyclic olefin copolymer is an amorphous thermoplastic that is finding increased utility as a blending agent in polyolefin packaging films for medical, consumer, and industrial markets. Cyclic olefin copolymer offers high transparency, outstanding moisture barrier, high stiffness and strength, and excellent biocompatibility in such applications as medical devices, food and pharmaceutical packaging, optics, and electronics. Among various applications, demand from Optical industry accounts for the largest market share with 38.70% in 2021.
