## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Optical incremental rotary encoder is an instrument for measuring rotational motion, which converts the rotation Angle into an electrical signal output through components such as optical sensors and gratings. Unlike absolute encoders, incremental encoders output the amount of change in relative position or rotation Angle, usually requiring a reference point for the starting position. Optical incremental rotary encoders are suitable for applications where information such as rotation speed, position and direction need to be measured.
