An Optical Micro Prism, often referred to as a 'Micro Prism' or 'Microprismatic Structure,' is a specialized optical component designed to control and manipulate the behavior of light. These micro prisms are characterized by their extremely small size and precise geometrical features, making them suitable for various optical applications. They are typically made from materials with high optical transparency, such as glass or plastic.

Key characteristics of optical micro prisms include:

Size: Optical micro prisms are significantly smaller than traditional prisms, often with dimensions on the order of micrometers (μ m) or even smaller.

Microscale Features: They have microscale geometrical features, including tiny facets, angles, and surfaces that interact with light.

Light Manipulation: These prisms are used to control the direction, polarization, or dispersion of light at the microscale, enabling a range of optical functions.

Light Diversion: Optical micro prisms can divert or redirect light beams within a very confined space, making them useful in micro-optical systems.

Integrated Optics: They are often integrated into micro-optical systems and devices, such as microscopes, fiber optics, and photonic chips.

Optical micro prisms are a crucial component in various micro-optical systems and devices that require precise control over light at the microscale. Their small size and ability to manipulate light make them valuable in fields such as microelectronics, micro-optoelectromechanical systems (MOEMS), microfluidics, and microscale imaging. These components enable advanced applications in micro-optics, microspectroscopy, and other emerging technologies.
