?An optical resonator is a cavity in which light waves are reflected back and forth, thereby providing feedback of light energy. ? It is an essential component of the laser and usually consists of two flat or concave spherical reflectors perpendicular to the axis of the active medium. The main functions of the optical resonant cavity are twofold: one is to provide positive feedback to ensure that light energy continues to circulate and increase in the cavity; the other is to control the characteristics of the oscillating beam in the cavity, including direction and frequency.
