An optical window is a planar light-transmitting element installed on the housing of an optical system or equipment. Its core function is to allow light of a specific wavelength to pass through efficiently and stably without significantly altering the beam characteristics, while isolating the environment (such as vacuum, pressure, dust, and corrosive media). These elements are typically made of quartz glass, optical glass, sapphire, or infrared materials, and their transmittance, reflection loss, and optical distortion are controlled through precision machining and coating. They are widely used in laser equipment, infrared imaging, semiconductor manufacturing, vacuum chambers, and industrial inspection systems, serving as a fundamental functional component in optical systems that balances protection and performance. In 2025, sales volume was 5.5 million units, with an average price of \$40, total production capacity of 6 million units, and a gross profit margin of 37%.

United States market for Optical Transmission Window is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
