An optical trap system is a scientific instrument that uses highly focused laser beams to trap and manipulate microscopic particles such as cells, organelles, or dielectric beads without physical contact. By exploiting the radiation pressure and gradient forces of light, the system can hold and move objects in three dimensions with nanometer-scale precision, making it invaluable for studying mechanical properties, molecular interactions, and biological processes at the microscale. Widely used in physics, biology, and materials science, optical trap systems enable experiments ranging from probing DNA elasticity and protein folding to manipulating single cells in microbiology or assembling nanostructures. For optical trap system, a realistic average purchase price is US$500k–$800k per system, with wide dispersion by configuration. The average annual sales volume is approximately 100 units.

United States market for Optical Trap System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
