Optical turnstile is a barrier-free passage management device that uses infrared or laser sensing technology to achieve precise control of personnel passage through optical detection. Its core feature is to eliminate the traditional mechanical blocking structure and use multiple sets of infrared sensors to form an invisible detection area, which can identify the direction, speed and number of personnel passing through, and trigger an audible and visual alarm when unauthorized. The device has a simple appearance and a smooth passage experience. It is suitable for places with high requirements for aesthetics and convenience, such as high-end office buildings, shopping malls, museums, etc. Optical turnstiles are usually deeply integrated with access control systems, support non-contact permission management such as face recognition and QR code verification, and can upload passage data to the management platform in real time to achieve intelligent crowd monitoring and analysis.
