## Abstracts

The global Optically Clear Adhesive (OCA) for Consumer Electronics market size is predicted to grow from US\$ 1390 million in 2025 to US\$ 2125 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

Optically Clear Adhesive (OCA) for consumer electronics is a high-transparency, pressure-sensitive adhesive film (typically acrylic- or silicone-based) used to bond display layers—such as cover glass, touch sensor, polarizer, and display panel—while maintaining >99% light transmittance, low haze, precise refractive-index matching, bubble-free lamination, and long-term reliability under heat, humidity, UV exposure, and repeated touch, enabling slim bezels and high image quality in modern electronic devices.

Upstream, OCA depends on specialty monomers and polymers (acrylics/silicones), photoinitiators, stabilizers, release liners, and precision coating films; midstream, adhesive formulators polymerize resins, compound optical additives, coat ultra-uniform PSA layers via clean-room roll-to-roll processes, laminate liners, slit and die-cut products, and qualify them with optical, reliability, and lamination tests; downstream, display module makers and EMS providers laminate OCA between cover glass, touch sensors, polarizers, and panels for smartphones, tablets, wearables, TVs, and emerging AR/VR devices, with demand closely tracking consumer-electronics shipment cycles.

Projects under construction and planned globally include capacity expansions of high-clarity acrylic OCA coating lines in East Asia, new silicone-based OCA lines targeting foldable and curved displays, investments in solvent-free and low-VOC coating technology, development of ultra-thin and high-elasticity grades for next-generation

foldables and AR optics, localization of OCA supply near major display module clusters to reduce lead times, and reliability-focused R&D programs aimed at higher temperature, humidity, and UV resistance as consumer devices converge with automotive-grade display requirements.
