Optical material is a general term for materials with certain optical properties and functions used in optical experiments and optical instruments. At present, there are dozens of optical materials: colorless optical glass and tinted optical glass, infrared optical materials, optical crystals, optical quartz glass, artificial optical quartz crystals, microcrystalline glass, optical plastics, optical fibers, optical filters, aerospace plexiglass, opalescent diffuse glass, as well as related liquid materials. Among them, optical glass is most used in imaging components. As the modern optical industry and electronics industry, information technology and communications technology, close integration of optoelectronics technology, photonics technology and electronic industrial

technology in the optical manufacturing applications break through the optical components and optical field of the traditional concepts, at present, aspherical, diffractive optical components, processed with ultra-high-precision thin-film technology WDM wavelength-division multiplexing devices, with a new generation of photolithography equipment for the manufacture of ultra-high-precision optical components, etc. dominate the mainstream of new-generation optical components. In order to reduce costs and enhance competitiveness, the global optoelectronics-related industries have moved to mainland China. Among them, Japan's Canon, Olympus, Ricoh, Nikon, Minolta, Sony and other companies have digital cameras, LCD projectors and other products into the coastal areas of mainland China.
