The global Oral Solid Dosage Manufacturing market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Oral solid dosage manufacturing refers to the process of producing pharmaceutical products in solid form that are intended to be taken orally, such as tablets, capsules, and powders. This manufacturing process involves several steps, including formulation development, blending, granulation, compression, coating, and packaging.

Formulation development is the initial stage where the active pharmaceutical ingredient (API) and other excipients are selected and combined to create a stable and effective dosage form. Blending involves mixing the API and excipients to ensure uniform distribution of the drug throughout the dosage form. Granulation is the process of forming granules from the blended mixture to improve flowability and compressibility.

Compression is the step where the granules are compressed into tablets or filled into capsules using specialized equipment. Coating may be applied to tablets to improve appearance, taste, and stability, as well as to control the release of the drug. Finally, the finished dosage forms are packaged in appropriate containers, such as blister packs or bottles, and labeled for distribution.

Oral solid dosage manufacturing requires strict adherence to Good Manufacturing Practices (GMP) to ensure the quality, safety, and efficacy of the pharmaceutical products. This includes maintaining a controlled manufacturing environment, conducting regular quality control testing, and following standard operating procedures to prevent contamination and ensure consistency in the manufacturing process.
