A track damper is a device used to reduce or absorb vibration and shock in track systems. In railway transportation, track dampers are usually used to slow down the vibration and noise generated when trains pass through the track and improve the comfort and safety of the railway system. The working principle of track dampers usually involves the use of springs, shock-absorbing materials or other energy-absorbing devices to absorb or slow down the shock and vibration caused by trains passing over the track. This helps reduce noise levels and reduce wear and tear on trains and track structures while increasing the life of the rail system. The type and design of shock absorbers can vary depending on the specific application and rail system requirements.
