An ore sorting machine, also known as an ore sorter, is a specialized device used in mining and mineral processing to separate valuable minerals from waste or low-grade ore based on their inherent properties. Ore sorting is a process that utilizes various sensing technologies to analyze the composition of rocks and ores in real time, allowing for the selective separation of materials with different characteristics.

The goal of using ore sorting machines is to increase the efficiency of mining and processing operations by reducing the amount of material that needs to be transported, processed, and discarded as waste. This technology is particularly valuable for mines dealing with complex ore bodies, declining ore grades, and the need for more sustainable mining practices.
