## Abstracts

The global Ore Sorting System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The ore sorting system is a technology and equipment system used to separate useful components from useless components in ores. Its main purpose is to improve the grade of ore, increase the recovery rate of useful components, reduce production costs, and reduce environmental pollution.

With the development of artificial intelligence, machine learning and other technologies, ore sorting systems may achieve more intelligent and automated operations. For example, by introducing intelligent sensors, control systems and data analysis technology, real-time monitoring and analysis of ore composition, structure, grade and other information can be achieved, thereby optimizing mineral processing parameters and operating strategies, and improving sorting efficiency and recovery rate.
