Organoboron flame retardants are a class of organic compounds containing boron elements, which are designed to improve the flame retardant properties of materials. They are usually introduced into materials that require flame retardant treatment, such as textiles, plastics, rubber, etc., through chemical reactions or physical additions. Organoboron flame retardants can effectively improve the flame retardant properties of materials by slowing the spread of flames, reducing combustion temperatures and suppressing smoke production. Organoboron flame retardants are generally less toxic than some other types of flame retardants, which increases their appeal in certain applications. Organoboron flame retardants can reduce the production of smoke during combustion, which is critical for fire safety. Although organoboron flame retardants have many advantages, their hydrolytic instability limits their use in certain applications that require water washability.

The global Organic Boron Flame Retardant market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
