The organic electron transport layer (ETL) is a component of organic electronic devices such as organic light-emitting diodes (OLEDs) and organic photovoltaic (OPV) cells. The primary function of the ETL is to facilitate the transport of electrons from the active layer (the layer where light emission or energy conversion occurs) to the cathode, while also acting as a barrier to holes (positively charged particles) to prevent them from recombining with electrons prematurely.

The global Organic Electron Transport Layer (ETL) market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
