Organic gemstones are gemstones that are produced by a living organism. Unlike other gemstones that are made of minerals, organic gemstones are renewable and in some cases can be farmed (like Pearls).

The class of organic gems is small but includes a number of unusual varieties that are important in the gem trade; amber, coral, jet, ivory and pearl. Amber has been used since prehistoric times for jewelry, amulets and religious objects. The most prized pieces contain inclusions of insects, plants or pyrite. Gem-quality coral is related to reef-forming corals, and the most valuable coral variety is found in the Mediterranean, the Red Sea and in coastal Japan. Jet was extremely popular in the 19th century, but now is rarely found. Jet is actually bituminous coal that can be polished. Pearls are the most

important of all the organic gems. One of the unique features of pearls is that they do not require any processing - they exhibit an attractive pearly luster in their natural state
