Organic grains are grains that are produced without the use of chemical compounds (such as pesticides, fertilizers, and additives), nor can radiation, industrial solvents, or chemical food additives be used in the production of organic grains. The amount of available scientific data does not yet show that organic cereals and general cereals have stable and significant differences in safety, nutritional value and taste. In most of human history, agriculture can be described as organic; only in the 20th century were many synthetic chemicals introduced into the grain supply. The organic agriculture movement emerged as a response to agricultural industrialization in the 1940s and is known for its green revolution. Organic cereal production is an industry strictly regulated by the government. Today, the European Union, the United States, Canada, Japan, and many other countries require producers to obtain special certifications before they can be sold on the market as organic grains in their home country.
