Organic halogen flame retardants are flame-retardant compounds based on halogen-containing organic molecules, primarily incorporating bromine or chlorine. These retardants function by releasing halogenated species such as hydrogen bromide (HBr) or hydrogen chloride (HCl) during combustion, which act as radical scavengers to disrupt the chain reaction of flame propagation. Common forms include aromatic, aliphatic, or cycloaliphatic halogenated compounds. They are valued for their high flame-retardant efficiency, low loading levels, and good compatibility with various polymers. Widely used in thermoplastics, thermosets, rubbers, fibers, and electronic components, representative examples include decabromodiphenyl ether (DecaBDE), tetrabromobisphenol A (TBBPA), and hexabromocyclododecane (HBCD).

United States market for Organic Halogen Flame Retardants is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
