Organic medical elastomers are a class of elastic materials used in medical applications, often made from organic compounds. These elastomeric materials are chemically tunable and can be tailored to specific medical needs. They are highly elastic and flexible and can withstand the mechanical stresses during physiological activities while providing comfort and durability. Because these materials are often biocompatible, they can come into direct contact with human tissue without causing an immune response or other side effects. This makes them widely used in the manufacture of medical devices and equipment, such as medical catheters, prostheses, implants, wound dressings, etc. Common organic medical elastomers include polyurethane, silicone, and thermoplastic elastomers, which play important roles in different medical applications.

The global Organic Medical Elastomers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
