Organic photoelectric materials refer to organic materials with photoelectric conversion function and photoelectric activity. It is widely used in organic light emitting diodes, organic transistors, organic solar cells, organic memories and other fields. Organic optoelectronic materials are usually organic molecules rich in carbon atoms and with large π conjugation system, which can be divided into small molecules and polymers. Compared with inorganic materials, organic optoelectronic materials can be prepared in large area and flexible devices by solution method. In addition, organic materials have diverse structural composition and broad performance adjustment space, which can obtain the required performance through molecular design, and can prepare nano devices and molecular devices through bottom-up device assembly methods such as self-assembly.
