The global Organic Solar Cells (OSCs) market size is predicted to grow from US\$ 146 million in 2025 to US\$ 305 million in 2032; it is expected to grow at a CAGR of 11.3% from 2026 to 2032.

In 2024, global Organic Solar Cells (OSCs) reached approximately 296.38 MW, with an average global market price of around US\$ 478.33 per KW. Gross margin is about 15%. The cost is 406.58 usd. Production Capacity is about 320-350 MW. Organic Solar Cells (OSCs) refer to a type of solar cell technology that utilizes organic materials in the form of thin films to convert sunlight into electricity. These cells are part of the broader category of organic photovoltaic (OPV) cells, which are characterized by the use of organic (carbon-based) materials as the active components for light absorption and charge generation. The upstream sector mainly includes organic semiconductor materials (conjugated polymers, small molecule acceptors), conductive and transparent electrode materials (such as ITO), substrate film materials (PET, glass), encapsulation materials, and printing/coating equipment. The midstream sector involves OPV device manufacturing, including thin-film deposition, interface treatment, encapsulation, and electrode fabrication, forming flexible or rigid photovoltaic modules. Downstream applications include portable electronics, building-integrated photovoltaics (BIPV), lightweight roofs, wearable devices, and can also integrate energy storage systems or grid-connected systems to provide power.

1. Efficiency Improvement and Material Innovation

In recent years, through novel conjugated polymers, small molecule acceptor materials, and tandem/multi-junction structure designs, laboratory efficiencies have exceeded 19–20%, approaching the level of crystalline silicon solar cells. New materials

emphasize broad-spectrum absorption, low energy loss, and high carrier mobility, while non-fullerene acceptors (NFAs) are used to replace traditional PCBM, improving photovoltaic performance.

2. Expanded Applications Due to Flexibility and Lightweighting

The flexibility, lightweight, and rollable nature of organic thin-film solar cells have made them increasingly popular in building-integrated photovoltaics (BIPV), wearable electronics, and portable devices. The maturity of roll-to-roll printing technology has reduced the cost of large-scale production, continuously expanding application scenarios.

3. Improved Stability and Lifespan

Traditional OPVs face short lifespans (typically
