The general formula of functional silanes is RnSiX(4-n), where R is a non-hydrolyzable organic moiety, which is an alkyl, aryl, organic functional group (such as vinyl, amino, epoxy, mercapto, etc.) or these Any combination of groups can react or be close to organic groups; in the formula, X is a hydrolyzable group, such as halogen, alkoxy, siloxane, acetoxy, etc., which can produce Si-OH through hydrolysis, so that Reacts with inorganic materials. Functional silane contains both organophilic and inorganic functional groups. It can be used as an interface bridge between inorganic materials and organic materials or directly participate in the crosslinking reaction of organic polymer materials, thereby greatly improving the performance of materials. It is a very important and widely used Additives, widely used in rubber processing, adhesives, composite materials, metal surface treatment and building waterproofing and other fields. There are different classification methods for functional silanes: according to the relative substitution position of active organic groups and Si, they can be divided into two types: ?-substitution and ?-substitution; according to the application, they can be divided into silane coupling agent, silane crosslinking agent and others Functional silane, silane coupling agent can be further divided into sulfur-containing, amino, vinyl, epoxy, acryloxy and other categories.
