Orthokeratology is a contact lens that a child wears overnight to correct blurry distance vision during the day. Also called Ortho-K, the lenses flatten your cornea while you sleep. The next day, light passing through the reshaped cornea falls precisely on the retina, making distant images appear clearer.

Wearing Ortho-K lenses only improves vision for a short time. Once you stop wearing the lenses, the cornea slowly goes back to its normal shape and myopia comes back. Still, ortho-K may provide some permanent reduction in myopia progression.

There is a risk of infection with Ortho-K lenses. They are also more difficult to fit compared to regular contacts lenses, and more follow-up visits to the doctor are needed.

The global Ortho-k Contact Lenses for Myopia Control market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
