An orthopedic cable system is a medical device used in orthopedic surgery to provide additional support and stabilization to fractured bones or bone fragments. It is commonly used in procedures such as fracture fixation, osteosynthesis, and ligament repair.

The cable system consists of a combination of cables, screws, and other components that work together to secure bone fragments or bone-to-bone connections. The cables are typically made of high-strength materials such as stainless steel or titanium. They are flexible and can be tensioned to provide compression and stability to the fractured bone.

Orthopedic cable systems are designed to allow for proper alignment and fixation of bone fragments, promoting healing and reducing the risk of complications. They are often used in conjunction with other fixation devices like plates, rods, or screws to provide additional support.
