An Orthopaedic Trauma External Fixation System is a medical device used in the treatment of severe bone fractures and injuries. This system involves the placement of pins or screws into the bone fragments, which are then connected to an external frame outside the body. The external frame stabilizes the bones, maintaining proper alignment and promoting healing. This technique is particularly useful for complex fractures, open wounds, or when internal fixation is not feasible. External fixation allows for easy adjustment, access to the injury site for wound care, and can be a temporary or definitive solution depending on the injury's severity and location.

The global Orthopaedic Trauma External Fixation System market size is projected to grow from US\$ 1935 million in 2024 to US\$ 3176 million in 2030; it is expected to grow at a CAGR of 8.6% from 2024 to 2030.
