Orthopedics is that branch of medicine which treats the damages of the skeletal system, ligaments, and muscles. It comprises prosthetics (devices that substitute for a limb or joint) and orthotics (lower back support and knee braces). Since the first use of artificial legs, the orthopedics market has come a long way. The biggest leap in technology occurred in the late 1980s with the advent of composite materials in the production of orthopedic devices. Orthopedic devices made from composite materials deliver excellent features such as lightweight, durability, and corrosion resistance. Owing to these advantages, composite materials started gaining traction in sporting events such as the Paralympic and Olympic. However, the high cost of these materials is still acting as a bottleneck towards the greater adoption among the user base.
