## Abstracts

The global Oscillating Piston Meters market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The oscillating piston flowmeters are a sort of positive displacement flowmeter and often referred to as volumetric counters. They are flowmeters especially suited for measuring high viscosity liquids. However, they are also most suited for liquids with a low viscosity.

Oscillating Piston Meters are a type of positive displacement meters that are used to measure the volume or flow rate of liquids, such as water, oil, or fuel. Oscillating Piston Meters consist of a cylindrical chamber that contains a piston that oscillates or rotates around a central axis. The piston has a circular opening that aligns with the inlet and outlet ports of the chamber, allowing the liquid to enter and exit the chamber in discrete volumes. The piston is driven by the pressure difference between the inlet and outlet ports, and its oscillation or rotation is transmitted to a register that counts the number of cycles and displays the volume or flow rate of the liquid. The industry trend of Oscillating Piston Meters is positive and growing, as the demand for accurate and reliable liquid measurement solutions is increasing in various end-use industries, such as oil & gas, water & wastewater, chemical, food & beverage, and pharmaceutical. The major drivers for the market growth are the rising population, the increasing urbanization, the growing industrialization, and the stringent environmental and safety regulations. The major challenges for the market growth are the high initial investment, the maintenance cost, and the impact of COVID-19 pandemic. The market players are focusing on developing new technologies and products to overcome the challenges and meet the customer needs.
