The oscillating tube gas densitometer is a gas density measuring instrument based on the resonance principle. The oscillating tube gas densitometer uses the resonant frequency of the gas in the oscillating tube to measure the density of the gas. When the gas is placed in the oscillating tube, the oscillating tube will vibrate under the action of the gas. There is a specific relationship between the frequency of this vibration and the density of the gas, that is, when the density of the gas changes, the oscillation frequency of the oscillating tube will also change accordingly. By measuring this frequency change, the density of the gas can be calculated.
