The osteoporosis treatment instrument is a medical device used to treat osteoporosis. The main principle is to stimulate the growth and proliferation of bone cells through low-frequency pulsed electromagnetic fields, thereby promoting the formation and repair of bone. Osteoporosis treatment equipment usually consists of a host and a treatment pad. The treatment pad can be placed on the area that needs treatment, and the host can set parameters such as treatment time and intensity through the controller. When using, place the treatment pad on the area that needs treatment, and then connect the treatment pad to the host. Set the treatment time and intensity through the controller to achieve the treatment of osteoporosis. The osteoporosis treatment device can promote the growth and proliferation of bone cells, thereby promoting the formation and repair of bone, and is a very effective method for treating osteoporosis.
