Operational technology (OT) secure remote access software is used to secure remote connections between operators and OT environments. Typically, these consist of industrial equipment and machinery that present physical and digital risks if compromised. Companies use OT secure remote access software to manage users, allocate access privileges, and monitor behaviors for anomalies, threats, or misuse. These tools are traditionally managed by IT and security teams who specialize in complex industrial environments. Increasingly connected equipment and expanding remote workforces have increased the need for businesses to securely control access to their OT. These tools have similar features to many privileged access management (PAM) software and IoT security software. However, unlike OT secure remote access software, neither tool is designed to secure business-critical operational environments.

The global OT Secure Remote Access Software market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
