A patio heater, also known as an umbrella or mushroom heater, is a radiant heating appliance that generates thermal radiation in outdoor spaces. Patio heaters run on natural gas or propane gas. They also run on electricity. During the operation of a patio heater, heat is radiated in a circular pattern around the appliance. Patio heaters facilitate the provision of warmth in their vicinity.

Propane and natural gas heaters, a burner on top of a pole, it burns liquefied petroleum gas (LPG), propane or butane, and directs the flames against a perforated metal screen. Heat is radiated from the surface of the screen in a circular pattern around the appliance. A reflector at the top of the burner reflects heat that would be otherwise lost upwards. This is because the reflecting hood is usually silvered which makes it a poor absorber of heat but excellent at reflecting infrared radiation back. This reduces the amount of heat lost by conduction as silvered surfaces will not absorb infrared light.
