An overground puzzle parking system is a type of mechanical parking system designed to maximize parking capacity in constrained urban environments by utilizing vertical space. In this system, vehicles are parked on multiple levels above ground, with each parking space arranged in a puzzle-like configuration to minimize the footprint of the parking facility. Vehicles are typically parked on steel platforms or pallets, which are raised and lowered vertically by hydraulic or electric lifts to access the desired parking level. The system operates on a 'first-in, last-out' basis, meaning that the last vehicle parked is the first one retrieved. Overground puzzle parking systems are often fully automated, with users able to retrieve their vehicles using a touchscreen interface or mobile app. These systems offer several advantages, including efficient use of space, rapid parking and retrieval times, and enhanced security for parked vehicles. They are commonly used in densely populated urban areas where land is limited and parking demand is high, providing a convenient and space-efficient solution to parking challenges.

The global Over Ground Puzzle Parking System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
